

SURVEY ANALYSIS

Participant Profile

Age Distribution

A total of **42 responses** were received for the LoanEase UX Research Survey. After applying participant consent criteria, **41 valid responses** were included in the analysis.

Most respondents belonged to the **18–25** and **26–35** age groups, indicating that the survey primarily represents young adults and early-career professionals who are active users of digital banking services.

Age Group	Count
18–25	22
26–35	16
36–45	3

Interpretation

Most respondents belong to the **18–35** age range.

This is beneficial because these users are among the primary users of digital banking and mobile applications.

Occupation Distribution

In terms of occupation, the majority of participants were **salaried employees**, followed by **students**, with a smaller number of self-employed individuals and homemakers. This diverse participant pool provided perspectives from both experienced and potential future loan applicants.

Occupation	Responses
Salaried Employee	28
Student	9
Self-employed	3
Homemaker / Household Manager	1

Occupation Distribution

Interpretation

The majority of participants are **salaried employees**, followed by **students**.

This is useful because salaried employees are a common audience for personal, home, and vehicle loans, while students provide insight into the expectations of potential future users.

Previous Loan Experience

The survey also included participants with and without prior loan application experience, enabling the study to capture insights from existing users as well as individuals who may use digital loan services in the future.

Response	Count
No	22
Yes	19

Participants Previous Loan Experience

■ No ■ Yes ■ ■

Interpretation

The responses are almost evenly split between participants who have previously applied for a loan and those who have not.

Loan Experience Analysis

Previous Loan Experience

Of the 41 valid participants, 19 had previously applied for a loan, while 22 had not. This provided insights from both experienced applicants and potential future users.

Response	Count	Percentage
Yes	19	46.3%
No	22	53.7%

Interpretation

Almost half of the participants have already experienced a loan application, while the other half represent potential future users.

Types of Loans Applied For

Personal loans were the most common loan type reported, followed by gold, home, education, and vehicle loans.

Loan Type	Responses
Personal Loan	11
Gold Loan	5
Home Loan	4
Education Loan	4
Vehicle Loan	4
Business Loan	1

Types of Loans Applied For

Interpretation

The most common loan type was **Personal Loan**, followed by **Gold Loans**.

How Users Applied

The majority of participants who had applied for loans used **mobile banking applications**, indicating a clear preference for digital channels.

Method	Responses
Mobile Banking App	9
Loan Agent	3
Bank Branch	3
Bank Website	2
Other (credit apps, etc.)	2

Interpretation

The **Mobile Banking App** was the most frequently used channel.

Overall Satisfaction

Satisfaction ratings were generally positive, with most respondents selecting **4 or 5** on a five-point scale. However, a small number of participants expressed dissatisfaction, suggesting opportunities to improve the digital loan application experience.

Rating	Responses
1	1
2	1
3	6
4	7
5	4

Interpretation

Most participants selected **4 or 5**, suggesting generally positive experiences, while a smaller group reported dissatisfaction.

Pain Point Analysis

Challenges Faced During the Loan Application Process

The purpose of this analysis is to identify the most common challenges users face during the digital loan application process. Understanding these pain points helps UX designers prioritise the issues that need to be addressed in the proposed solution.

This analysis combines three sources of information:

- Challenges selected by participants.
- The stage of the application process they found most difficult.
- Open-ended comments describing their biggest challenge.

Challenges Faced During the Loan Application Process

Challenge	Number of Responses
Lengthy approval process	10
Understanding eligibility criteria	9
Lack of application status updates	7
Collecting required documents	6
Poor customer support	5
Technical issues while applying	4
Hidden charges or unclear fees	4
Difficulty understanding loan terms	4

Interpretation

The most frequently reported challenge was the **lengthy approval process**, selected by **10 participants**. This indicates that delays during the approval stage significantly affect the overall user experience.

The second most common issue was **understanding eligibility criteria** (9 responses), suggesting that many users find it difficult to determine whether they qualify for a loan before beginning the application.

Another major concern was the **lack of application status updates** (7 responses). Users expect transparency throughout the application process and become uncertain when there is no information about the progress of their application.

Participants also highlighted challenges related to **collecting required documents**, **customer support**, **technical issues**, **hidden charges**, and **understanding loan terms**. Although these issues were reported less frequently, they still represent opportunities for improving the overall experience.

Most Difficult Stage

This analysis identifies the stage of the loan application process that participants found most difficult. Understanding where users struggle the most helps prioritise improvements within the user journey.

Stage	Responses
Waiting for approval	8
Checking eligibility	4
Uploading documents	3
None of the above	2
Filling the application	1
Understanding the final decision	1

Interpretation

The **waiting for approval** stage was identified as the most difficult by the majority of participants. This finding aligns with the earlier result showing that a lengthy approval process is the most common challenge.

Some participants also reported difficulties while checking eligibility and uploading documents. Fewer participants experienced problems while filling out the application or understanding the final decision.

Overall, the findings indicate that delays and uncertainty after submitting the application have a greater impact on user satisfaction than the application form itself.

Open-Ended Feedback

Participants were invited to describe, in their own words, the biggest challenge they experienced during the loan application process. These qualitative responses provide context that complements the quantitative survey results.

Theme	Example Observation
Document handling	Difficulty managing and submitting required documents, especially remotely.
Lack of status updates	Users wanted better communication after submitting their applications.
Long waiting periods	Delays during approval created frustration and uncertainty.
Technical issues	Some participants experienced slow or unreliable application performance.
Eligibility and loan terms	Users found eligibility criteria and terms difficult to understand.
Customer experience	Some participants reported poor communication or support after taking the loan.

Interpretation

The qualitative responses reinforce the survey findings. Participants repeatedly mentioned uncertainty during the approval stage, difficulty understanding requirements, and inadequate communication from lenders.

Unlike multiple-choice questions, these comments provide additional context and help explain why users perceived these issues as frustrating.

Feature Expectations & User Trust Analysis

Desired Features in a Digital Loan Application Platform

The purpose of this analysis is to understand what users expect from a modern digital loan application platform and how comfortable they are using digital financial services.

These findings help identify the features that should be prioritised in the proposed LoanEase application.

Feature	Responses
Real-time application status tracking	27
EMI calculator	26
Loan eligibility checker	25
Live chat / Customer support	24
Document upload progress	22
Estimated approval timeline	21
Simple explanations of loan terms	19
Loan comparison tool	16

Interpretation

The most requested feature was **Real-time Application Status Tracking**, selected by **27 participants**. This directly supports the earlier finding that users are frustrated by long approval times and the lack of updates.

Other highly requested features included an **EMI Calculator** and a **Loan Eligibility Checker**, indicating that users want to understand their financial commitments and eligibility before submitting an application.

Participants also valued **Live Chat/Customer Support**, **Document Upload Progress**, and **Estimated Approval Timelines**, showing that users expect continuous guidance and transparency throughout the application process.

Although selected less frequently, **Loan Comparison Tools** and **Simple Explanations of Loan Terms** remain valuable additions that could further improve decision-making and user confidence.

Importance of Real-Time Updates

This analysis evaluates how important users consider receiving real-time updates during the loan application process.

Rating	Meaning	Responses
1	Not Important	4
2	Slightly Important	2
3	Neutral	1
4	Important	8
5	Extremely Important	26

Interpretation

Most participants rated real-time updates as **Extremely Important (5)**, with an additional **8 participants** rating them as **Important (4)**.

Only a small number considered real-time updates to be of low importance.

This indicates that keeping users informed throughout the application process is a major expectation rather than an optional convenience.

Confidence in Uploading Documents

This analysis measures how comfortable users feel uploading important documents through a digital loan application platform.

Understanding user confidence helps identify trust-related concerns that should be addressed in the design.

Rating	Meaning	Responses
1	Not Confident	7
2	Slightly Confident	5
3	Neutral	6
4	Confident	9
5	Very Confident	14

Interpretation

While many participants reported being **Confident** or **Very Confident**, a noticeable number expressed low confidence or uncertainty when uploading important documents online.

This suggests that trust remains a concern for some users, particularly when sharing sensitive financial information.

Future Adoption Intent

This analysis examines whether participants would consider using a well-designed digital loan application platform in the future.

Response	Count
Yes	36
Maybe	5
No	0

Interpretation

An overwhelming majority of participants (**36 out of 41**) indicated that they would consider using a well-designed digital loan application platform in the future. The remaining participants selected **Maybe**, while none rejected the idea outright.

These findings suggest strong acceptance of digital loan services, provided the platform addresses existing usability concerns.
